

Title: Evaluation of spring wheat cultivar performance on fallow in central Montana. (4W2755)

Principal Investigator: David M. Wichman, Agronomist, CARC – Moccasin

Objectives: To evaluate the performance of spring wheat on fallow in central Montana. Provide unbiased information on improved cereal cultivars for producers to use in the selection of best suited cereal grain varieties for central Montana and other areas with similar crop environments.

Results:

No off-station spring wheat trials were established on fallow by CARC staff. The majority of fallow acres going into 2009 wheat were seeded to winter wheat in central Montana.

Summary:

No summary

Funding Summary:

Expenditure information to be provided by OSP
No other grant support for this project

MWBC FY2011 Grant Submission Plans:

Researcher is not certain at this time. Establishing spring wheat trials on fallow in central Montana is not a top priority. Winter wheat generally produces much higher yields on fallow. Re-crop spring wheat cultivar evaluations will continue to receive a higher priority than spring wheat on fallow.
