

# The Effects of Direct Mathematical Instruction in Science Classes on Mathematical Based Science Reasoning

Katie Capp, Belgrade High School, Belgrade, MT 59714

July 2017

## GOAL

- The goal of this project was for students to be able to use and articulate mathematical reasoning strategies when approaching scientific tasks.
- To accomplish this, sophomore level Biology (Genetics) curriculum was pervaded with mathematical instruction.

## BACKGROUND

- The nature of science outlined by the Next Generation Science Standards (NGSS) reveals the multidimensional components that comprise scientific practices and understanding.
- Within the eight NGSS science and engineering practices, six use mathematics as a foundation of or tool for science.

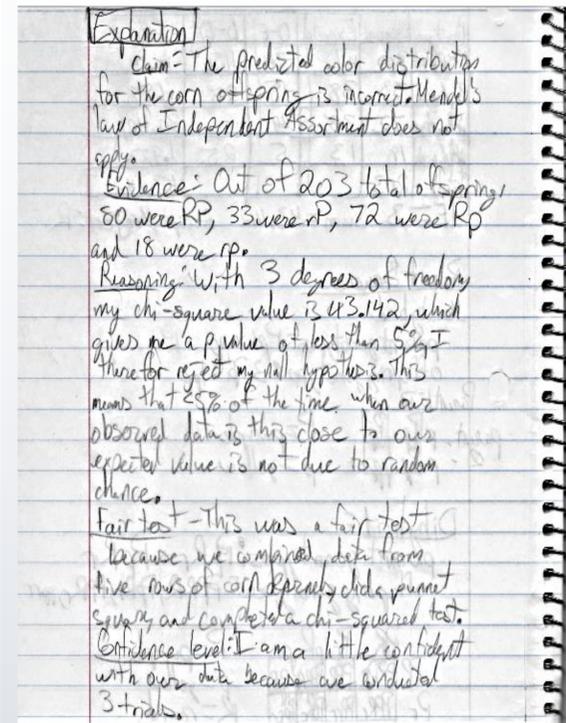

## METHODOLOGY

- Students explored Genetics based Biology concepts while receiving direct instruction on statistical analysis as a tool for developing scientific reasoning skills, such as, scientific claim, evidence, and reasoning.
- Student laboratory investigation claim:
  - Does Indian corn follow Mendel's Law of Independent Assortment?

Students: Parker T., Savana J., and Travis B. recording the occurrence of phenotypes in monohybrid and dihybrid ears of corn.

## STUDENT EXPLANATION

## CONCLUSION

- The results indicated that by implementing direct Mathematics instruction on standards-based Biology concepts, students gained a greater understanding of Genetics concepts and were able to develop a more thorough claim, evidence, reasoning explanation for a standard Genetics laboratory investigation.

## DATA AND ANALYSIS

- Data collection for this project involved completion of scoring rubrics by both the student and teacher following a Genetics based laboratory exercise, as well as, a Genetics summative assessment concluding the three week unit of study.
- Students were evaluated on a point scale that included: stating a claim, providing evidence, data-based reasoning, and making an argument.

## VALUE

- Students may not see the inherent benefit in using mathematics as a method of scientific reasoning until later in their educational career.
- My goal: That the reasoning skills students gain by practices being paralleled in both math and science be able to be applied to new or novel endeavors.
- Using mathematics in the science classroom serves to broaden students' repertoire of data analysis and reasoning.
- Mathematics need not be confined solely to math class, the same is true with science.
